1. Introduction

APRO Rugged Metal 2.5" SATA MLC SSD – BON Series provides high capacity flash memory Solid State Drive (SSD) that electrically complies with Serial ATA 2.6 (SATA) standard and support SATA Gen-II (3.0 GB/s) with high performance. The main used flash memories are Samsung MLC-NAND type flash memory chips. The available disk capacities are 8GB, 16GB, 32GB, 64GB, 128GB, and 256GB.

The operating temperature grade is optional for commercial level 0°C ~ 70°C and wide temperature level with special conformal coating supports -40°C ~ +85°C. The data transfer performance by sustained read is up to 175.1 MB/sec (Max.).

The APRO Rugged Metal 2.5" SATA MLC SSD product provides a high level interface to the host computer. This interface allows a host computer to write commands to the 2.5" SATA SSD to read or write blocks of memory. Each sector is protected by a powerful 8 bits or 15 bits Error Correcting Code (ECC). APRO Rugged Metal 2.5" SATA MLC SSD BON Series intelligent controller manages interface protocols, data storage and retrieval as well as ECC, defect handling and diagnostics, power management and clock control.

APRO Rugged Metal 2.5" SATA MLC SSD – BON Series supports Fast Erase/Secure Erase which initiates by hardware design and software vendor commands. APRO's Fast Erase Procedure is one of Default Sanitize procedure in BON Series Secure Erase SSD Series. Fast Erase enables users to erase entire disk contents in a matter of second; 8GB SSD needs about 6 seconds, and 128GB needs about 60 seconds to run the fast erase procedure for whole disk completely. **Furthermore, BON Series Rugged Metal 2.5" SATA MLC SSD also support Secure Erase (Sanitizing procedures) include NSA Manual 130-2, USA-AF AFSSI 5020, DoD 5220.22-M and IREC (IRIG) 106 standards by different special firmware versions.**

1.1. Scope

This document describes the features and specifications and installation guide of APRO Rugged Metal 2.5" SATA MLC SSD – BON Series. In the appendix, there provides order information and warranty policy for the most convenient reference.

1.2. Applicable Documents

- Serial ATA: High-speed serialized AT attachment, revision 1.0a, & revision 2.6 Serial ATA working group
- Parallel ATA: compatible with ATA/ATAPI-7.

1.3. Device Features

- Samsung MLC-NAND type flash technology
- In 2.5 inch SSD form-factor in 9.5 mm height rugged metal casing
- 8GB, 16GB, 32GB, 64GB, 128GB and 256GB capacity.
- SATA 7 pins (data) + 15 pins (power connector) host Interface
- Fast Erase/Secure Erase by Hardware jumper setting located on the front side of SSD (J1/Pin-1&Pin-2) and by Software Vendor Commands.
- **Support sanitizing procedures include NSA Manual 130-2, USA-AF AFSSI 5020, DoD 5220.22-M and IREC (IRIG) 106 standards by different special firmware versions.**
- Extremely rugged metal casing to endure harsh environments
- SATA interface complies with the SATA 1.0a and SATA 2.6 standard.
- SMART (Self-Monitoring, Analysis and Reporting Technology) function supported.
- Non-volatile memory and no moving parts
- Performance up to 175.1 MB/sec
- Automatic 8 bits or 15 bits error correction (ECC) and retry capabilities.
- +5 V $\pm 10\%$ operation
- Shock : 1,500G, compliance to MIL-STD-810F
- Vibration : 15G, compliance to MIL-STD-810F
- Working well in critical environment
- Very high performance, very low power consumption
- Low weight, Noiseless

2. Specification

2.1. Product Definition

The APRO BON Series 2.5" MLC SSD is a non-volatile mass memory storage unit equipped with a SATA interface. The SSD, whose dimensions enable mounting in a standard 2.5" disk drive enclosure, **Figure 1** shows a block diagram of the used high tech Industrial SATA MLC SSD controller.

Figure 1: BON Series 2.5" SATA SSD block diagram

2.2. Interface Description

The BON Series Industrial Rugged Metal 2.5" SSD's SATA interface complies with the SATA revision 1.0a and revision 2.6 standards. For specific details, refer to the applicable documents, as specified in Chapter 1.2.

2.3. Characteristics

2.3.1. SATA Modes

The BON Series Rugged Metal 2.5" SATA MLC SSD complies with the SATA revision 1.0a and revision 2.6 standards; and the data transfer rate complies with the following ATA modes (ATA/ATAPI-7)

- PIO mode 0, 1, 2, 3, 4
- MWDMA mode 0, 1, 2
- Ultra DMA mode 0, 1, 2, 3, 4, 5, 6

2.3.2. Burst Read/Write Performance

The SSD burst read/write rate is 150 MB/sec (1.5 Gb/sec) by SATA Gen-1.0a and 300 MB/sec (3.0 Gb/sec) by SATA Gen-2.6.

2.3.3. Sustained Read/Write Performance

Table 1: Device Performances

Flash IC		Samsung MLC Flash IC					
Data Transfer Mode supporting		Serial ATA Gen-II (3.0Gb/s = 380MB/s)					
Maximum Performance	Capacity	8GB	16GB	32GB	64GB	128GB	256GB
	Sequential Read (MB/s)	169.2	172.1	170.3	169.9	162.7	175.1
	Sequential Write (MB/s)	55.5	55.1	97.7	97.7	99.6	101.3
Maximum QD 32	4K Random Read (MB/s)	17.2	17.3	20.5	20.4	17.2	22.3
	4K Random Write (MB/s)	2.2	2.3	2.2	2.2	2.3	2.2
Random Access Time		0.2	0.2	0.2	0.2	0.2	0.2
The number of Flash IC		8	8	8	8	8	16

Notes:

(1). All values quoted are typically at 25°C and nominal supply voltage.

(2). Testing of the Rugged Metal 2.5" SATA MLC SSD maximum performance was performed under the following platform:

- Computer with AMD 3.0GHz processor
- Windows XP Professional operating system

(3). All performance values are tested by APRO and for reference only. We don't guarantee customers' testing results are same as APRO's.

2.3.4. Access Time

Average access time for the SSD is 0.1 ms (estimated)

2.3.5. Seek Time and Latency Time

The SSD has no seek time or Latency time.

2.3.6. Memory Capacity

APRO Rugged Metal 2.5" SATA MLC SSD – BON Series are built-in mainly Samsung MLC -NAND Type Flash memory chips. The **Table 2** shows the equal part number of applied Samsung Flash memory chips for each card.

Table 2: Card Configuration vs. Samsung NAND MLC part number

Card capacity	Samsung MLC flash memory part number * QTY
8GB	K9G8G08U0A (8Gb) or equal * 8
16GB	K9GAG08U0M (16Gb) or equal * 8
32GB	K9LBG08U0M (32Gb) or equal * 8
64GB	K9HCG08U1M (64Gb) or equal * 8
128GB	K9MDG08U5M (128Gb) or equal * 8
256GB	K9MDG08U5M (128Gb) or equal * 16

2.3.7. Power Consumption

Input voltage of +5VDC, with a tolerance of 10% (4.5V-5.5V) and a maximum ripple of 250 mV peak-to-peak are required.

Table 3 specifies the power consumption based on Capacity. The power consumptions are determined by the disk Capacity and the flash components being used.

Table 3: Device Power Consumption

Unformatted Disk Capacity	Idle Mode		Reading Mode		Writing Mode	
	mA	W	mA	W	mA	W
8GB -256GB Single Controlled	320	1.60	450	2.25	500	2.5

2.3.8. Endurance

- Un-limited Read Cycles

The SSD product life span and the performance are enhanced by the following features:

2.3.8.1. Flash Management Technology - Static Wear Leveling

In order to gain the best management for flash memory, APRO Rugged Metal 2.5" SATA MLC SSD – BON Series supports Static Wear leveling technology to manage the Flash system. The life of flash memory is limited; the management is to increase the life of the flash product.

A static wear-leveling algorithm evenly distributes data over an entire Flash cell array and searches for the least used physical blocks. The identified low cycled sectors are used to write the data to those locations. If blocks are empty, the

write occurs normally. If blocks contain static data, it moves that data to a more heavily used location before it moves the newly written data. The static wear leveling maximizes effective endurance Flash array compared to no wear leveling or dynamic wear leveling.

2.3.8.2. ECC Technology

Please refer to **Figure 2** is a diagram illustrating an allocation method of a spare area in each page of a NAND flash memory, wherein the specific ECC algorithm utilizes a Bose, Chaudhuri and Hocquengham (BCH) ECC algorithm. When a BCH 8 ECC algorithm encodes the data in the NAND flash memory, the parity code generated in the encoding process may occupy 13 bytes of the spare area in each page. When a BCH 15 ECC algorithm encodes the data in the NAND flash memory, the parity code generated in the encoding process may occupy 25 bytes of the spare in each page.

When a BCH 8 algorithm decodes the data in the NAND flash memory, the data can be decoded correctly if the error bit happened in one sector (512 Bytes) is 8. When a BCH 15 algorithm decodes the data in the NAND flash memory, the data can be decoded correctly if the error bit happened in one sector is 15.

Figure 2: Allocation for ECC Algorithm BCH in NAND Flash

2.3.8.3. Bad Block Management

Bad blocks of NAND flash may accumulate up to 2% of entire number of blocks during its manufacturing process and during the flash operational usage.

A system must be able to recognize bad block(s) based on the original bad block information and create a bad block table to keep track of blocks that fail during use. The first block of NAND Flash (block 0) is guaranteed to be good. The bad block information is stored in the reservoir area that is located in the highest address region of the NAND flash. Once the bad blocks have been located, and the bad blocks be no longer accessed.

To locate the bad blocks on a brand new device, read out each block. Any block that is not all FFFFh in 1st sector of 1st or 2nd page in a spare area is a bad block. Although random bit errors may occur during use, this does not necessarily mean that a block is bad. Generally, a block should be marked as bad only when there is a problem or erase failure. This can be determined by doing a status read after erase/program operation. The flash memory is initialized by formatting

the flash memory into a reserved area and user area.

In order to detect the initial bad blocks to handle run time bad blocks, APRO BON Series' SSD provides the Bad Block Management scheme. It remaps a bad block to one of the reserved blocks so that the data contained in one bad block is not lost and new data writes on a bad block is avoided.

2.3.9. Physical Specifications

Refer to **Table 4** and see **Figure 3** for APRO Rugged Metal 2.5" SATA MLC SSD – BON Series physical dimensions and Fast Erase / Secure Erase hardware jumper setting (**optional hardware setting**) specification.

Table 4: Device Physical Specifications

Capacity:	8GB to 256GB
Thickness:	9.50 mm / 0.374 in
Length:	99.70 mm / 3.925 in
Width:	69.90 mm / 2.752 in
Weight:	115.00 g / 4.06 oz

Figure 3: Device Dimension

2.3.10. LED Indicator

The SSD includes 3 LEDs, 1 green and 2 red, located on the front side of the SSD. These LEDs indicate the following, Refer to **Figure 4**:

1. Power (Green) LED: This is the SSD power indicator. When the power LED is lit, the SSD is receiving power.
2. Busy (Red) LED: This is the SSD busy indicator. When the busy LED is lit, the SSD is active.

2.3.11. Connector Interface

Refer to **Table 5** and see **Figure 4** for APRO Rugged Metal 2.5" SATA MLC SSD – BON Series pin assignments there are total of 7 pins in the signal segment and 15 pins in the power segment.

Figure 4: Device – SATA Pins and LEDs Configuration

Table 5: Device Signal and Power Segment Pin Assignments

Name	Type	Description
S1	GND	
S2	A+	Differential Signal Pair A
S3	A-	
S4	GND	
S5	B-	Differential Signal Pair B
S6	B+	
S7	GND	
Key and Spacing separate signal and power segments		
P1	NC	NC
P2	NC	NC
P3	NC	NC
P4	GND	
P5	GND	
P6	GND	
P7	V5	5V Power, Pre-Charge
P8	V5	5V Power

Product Specification

P9	V5	5V Power
P10	GND	
P11	DAS/DSS	Device Activity Signal / Disable Staggered Spin up
P12	GND	
P13	NC	NC
P14	NC	NC
P15	NC	NC

Notes:

All pins are in a signal row with a 1.27 mm (0.050" pitch).

The commands on the mating sequence in forward table apply to the case of backplane blind mate connector only. In this case, the mating sequences are:

- (1) The pre-charge power pins and other ground pins.
- (2) The signal pins and the rest of the power pins.

2.4. Environmental Specifications

The SSD complies with the specified performance requirements after exposure to non-operating environmental conditions, or during and after exposure to operating environmental conditions.

2.4.1. Temperature

2.4.1.1. Operating

The SSD operates without degradation over the following ambient air temperature range (the maximal temperature change rate shall not exceed 5°C per minute):

- Commercial Grade : 0°C to +70°C
- Industrial Grade : -40°C to +85°C (With special conformal coating treatment on PCBA)

2.4.1.2. Non-Operating

The SSD complies with the specified performance requirements after exposure to the following conditions (the maximal temperature change rate may not exceed 5°C per minute):

- Commercial Grade : -20°C ~ +80°C
- Industrial Grade : -50°C ~ +95°C (With special conformal coating treatment on PCBA)

2.4.2. Altitude

The SSD is capable of full operation at altitudes from sea level to 70,000 feet above sea level, and can withstand air transportation in non-pressurized flights at altitudes of up to 70,000 feet above sea level.

2.4.3. Relative Humidity

The SSD withstands 10% to 95% non-condensing relative humidity.

2.4.4. Shock

Product Specification

The SSD operates without degradation when subjected to shock testing of 1500 G half-sine pulses of 0.5 ms.

Shock analysis was performed compliant with standard MIL-STD-810F.

2.4.5. Vibration

The SSD operates without degradation when subjected to the following vibration conditions:

- 15G RMS
- Random vibrations: 3 vibration axes, 10 Hz to 2000 Hz.

Vibration analysis was performed compliant with standard MIL-STD-810F.

2.5. Conformal coating

Conformal coating is a protective, dielectric coating designed to conform to the surface of an assembled printed circuit board. Commonly used conformal coatings include silicone, acrylic, urethane and epoxy. APRO applies only silicone on APRO storages products upon requested especially by customers. The type of silicone coating features good thermal shock resistance due to flexibility. It is also easy to apply and repair.

Conformal coating offers protection of circuitry from moisture, fungus, dust and corrosion caused by extreme environments. It also prevents damage from those Flash storages handling during construction, installation and use, and reduces mechanical stress on components and protects from thermal shock. The greatest advantage of conformal coating is to allow greater component density due to increased dielectric strength between conductors.

APRO uses MIL-I-46058C silicon conformal coating.

3. Configuration of BON Series Rugged Metal 2.5" SATA MLC SSD

3.1. Secure Erase Jumper

When a jumper is placed between 2 of these headers (J1), the SSD erases the media immediately.

Figure 5: Secure Erase/Fast Erase Jumper Setting

3.2. Interface Connectors

The SSD interface cable consists of four conductors in two differential pairs, plus three ground connections. There are total of 7 pins in the signal segment and 15 pins in the power segment. All pins are in a single row, with a 1.27 mm (0.050") pitch. See **Figure 5**.

3.3. Supported ATA Commands

The commands supported ATA/ATAPI-7 commands; certain obsolesced commands are also supported. The supported commands are listed in **Table 6**.

Table 6: Device ATA Commands Supported

Command Name	Command Code (Hex)
CHECK POWER MODE	E5h
EXECUTE DIAGNOSTICS	90h
FLUSH CACHE	E7h
FLUSH CACHE EXT	EAh
IDENTIFY DEVICE	ECh
IDLE	E3h
IDLE IMMEDIATE	E1h
INITIALIZE DEVICE PARAMETERS	91h

WRITE MULTIPLE FUA EXT	CEh
WRITE SECTOR(S)	30h or 31h
WRITE SECTOR(S) EXT	34h

3.4. Vendor-Specific Commands

3.4.1. Sanitize

3.4.1.1. Sanitize (Purge) Command Interface

Destruction (purging/declassifying) of the information on the media is enabled by the Sanitize command. Bad blocks accumulated since the unit was manufactured undergo the same process as good blocks. Using either the Sanitize command itself, or using the Sanitize Interrupt command can activate the default sanitize procedure.

The Sanitize command provides a high degree of flexibility, which enables executing declassification procedures defined in various standards by providing different arguments to the command. Specifically, defining up to three stages of the declassification process is also enabled by the Sanitize command parameters. Each stage can be either erasing the media and overwriting it with a given character, or erasing the media and filling it with random information a specified number of times.

If the number of erase-fill cycles is 0xFF, the Sanitize command performs a complete erase but does not fill the media. The Sanitize command is the fastest option; and is also known as the Security Erase option. The structure of the Security Erase command is described in **Table 7**.

Table 7: Vendor-Specific Sanitize Command

Register	7	6	5	4	3	2	1	0
Features	Secondary operation code							
Sector count	Master command							
Sector number	Parameter 1							
Cylinder low	Parameter 2							
Cylinder high	Parameter 3							
Device/Head	1		1	D	Partition Mask			
Command	80h							

3.4.1.2. Compliance with Existing Sanitize (Purge) Standards

The interface specified in **Table 8** enables defining a wide range of Sanitize procedures.

Table 8: Device Supported Sanitizing Procedures

Operation	Master Command	Parameter		
		1	2	3
Execute the default Sanitize procedure.	0xff	0xff	0xff	0xff
Erase the media (Security Erase).	0x41	0xff	0xff	0xff

NSA Manual 130-2 Erase the media and overwrite with random data 2 times, then erase and overwrite with a character.	0x81	0x02	Char	0x00
USA-AF AFSSI 5020 Erase the media and overwrite with random data.	0x41	0x01	0x00	0x00
DoD 5220.22-M Erase the media and overwrite with single character, then erase again.	0x84	Char	0xff	0x00
IREC (IRIG) 106 Erase the media, overwrite with 0x55, erase, overwrite with 0xAA, erase	0XD0	0x55	0xAA	0x00
Erase the media and overwrite with random data (different data each time) 21 times.	0x41	0x15	0x00	0x00
Erase the media and overwrite with random data (different data each time) 381 times.	0xD5	0x7F	0x7F	0x7F

Notes:

1. Before every overwrite process, all blocks are erased as per the flash specification.
2. Blocks subjected to the Sanitize procedure are all blocks not registered in the original manufacturer's Bad Block Table.

3.4.1.3. Auto-Resume Sanitize Feature

When Auto-Resume is enabled (the manufacturer's default setting), if a power interruption takes place during a Sanitize procedure the SSD re-launches the Sanitize procedure on the next power-up.

If the Sanitize Interrupt command is active during power-up, the Sanitize procedure that was initiated before the power interruption is completed by the unit first. If the Sanitize interrupt command is still active when the procedure is complete, the SSD restarts the default Sanitize procedure. Auto-Resume Sanitize Feature is described in **Table 8**.

3.4.1.4. Random Data Written During the Sanitize Procedure

The random data used to overwrite user data is a digest of pseudo-random generation and real random data. The pseudo-random generation is seeded in such a manner that even if the SSD launches the Sanitize command under identical external conditions (for example, if the unit is powered on with Sanitize Interrupt active), it will produce different seeds and different pseudo-random data.

3.4.1.5. LED Activity During the Sanitize Procedure

During the Format and Sanitize procedures, the red LED status indication as follows:

- Remains lit during the Erase phase (for the Sanitize procedure, during each erase phase)
- Blinks during the Media Fill phase (for the Sanitize procedure, during each fill phase)
- Remains lit for a short period while the disk achieves ready status after completing the Sanitize procedures.

3.4.1.6. Using the SSD After a Sanitize Procedure

Performing a low-level format on the media is necessary if the fill option is non-activated (after completed Sanitize Procedures).

Failing to perform the low-level format may result in a longer start-up time.

3.4.1.7. Sanitizing Based on NSA Manual 130-2

Sanitizing semiconductor memory devices procedure is clarified by the USA National Security Agency (NSA) specifies as in documents “130-2 Media Declassification” and “Destruction Manual” (Paragraph 5, Section 7) which indicates the procedure for sanitizing EEPROM at version November, 2000.

- “Overwriting all locations with a pseudo-random pattern twice”.
- “Overwriting all locations with a known pattern”.

The SSD complies with the above requirement, as described in **Table 8**.

3.4.1.8. Sanitizing Based on USA Air Force AFSSI 5020

Sanitizing confidential media procedure is specified by the USA Air Force System Security Instruction (AFSSI) 5020, dated 20 August, 1996. Security procedure for all types of semiconductor media is elaborated in Chapter 5: Semiconductor Devices. The procedure for sanitizing flash memory is described in paragraph 5.3 as follows:

- “Pulsing the erase control gate and verifying the erasure”.
- “Overwrite all bit locations with arbitrary unclassified data”.

The SSD complies with the above requirement, as described in **Table 8**.

3.4.1.9. Sanitizing Based on DoD 5220.22-M

The sanitization processed for each media type (in order to be considered declassified) is specified in Chapter 8, Automated Information System Security. The sanitize process for EPROM media type is as follows:

- “Overwrite all addressable location with a single character.”
- “Perform a full chip erase as per manufacturer’s data sheet.”

The SSD complies with the above requirement, as described in **Table 8**.

3.4.1.10. Declassification Based on IRIG-106 (NTISSP-9)

The Telemetry Group (TG) of the Range Commanders Council (RCC) has prepared documents to foster the compatibility of telemetry transmitting, receiving, and signal processing equipment at the member ranges under the cognizance of the RCC.

IRIG (Inter-Range Instrumentation Group) 106 are set of Telemetry standards which provide the necessary criteria on which to base equipment design and modification.

The National Telecommunication & Information Security Systems (NTISSP-9) Chapter 10 describes the requirements for SOLID STATE RECORDER STANDARD. Section 10.8 (declassification) addresses declassification for various Solid-State Disks as follows:

- First Erase – Every memory block on the board is erased
- First write 0x55 – Every memory chip location is recorded with a pattern 0x55
- Second Erase – Every memory block on the board is erased
- Second write 0xAA – Every memory chip location is recorded with a pattern 0xAA
- Third Erase – Every memory block on the board is erased

APRO BON Series' SSD Sanitize feature complies with the above requirements as described in **Table 8**.

3.4.2. Security Erase Functionality

The Security Erase option enables quickly erasing all the data stored on the SSD. The SSD also supports the Fast Security Erase option, which is faster than the standard Security Erase option. This function is activated by the vendor-unique Sanitize command or via the Sanitize hardware interrupt triggered by the Secure Erase header (if available). To enable activating the Fast Security Erase option, please to study the **Appendix-A Hardware Fast Erase USER Manual**.

Typical power consumption during security erase depends on both the device Capacity and on the NAND flash type.

Table 9 describes the specifications for Security Erase operations. The SSD input voltage is +5VDC, with a tolerance of 10% (4.5V-5.5V) and maximum ripple of 250 mV peak-to-peak.

Table 9: Typical Power Consumption during Security Erase

Disk Capacity	Power Consumption During Security Erase-Read (Maximum)		Power Consumption During Fast Security Erase-Write (Maximum)	
	mA	W	mA	W
GB				
8-256GB Single Controlled	500	2.50	550	2.75

3.4.3. S.M.A.R.T. Function (Self-Monitoring, Analysis, and Reporting Technology)

According to the subcommand specified in the Features register, performing different processing requires predicting device failures. If the Features register contains an unsupported value, the Aborted Command error is returned. If the SMART function is disabled, any subcommand other than SMART ENABLE OPERATIONS results in the Aborted Command error.

3.4.3.1. S.M.A.R.T. Read Data

Table 10: SMART Feature registers values

Value	Command
D0h	SMATR Read Data
D8h	SMART ENABLE OPERATIONS
D9h	SMART DISABLE OPERATIONS

Table 11: SMART command for inputs information

Register	7	6	5	4	3	2	1	0

6. Procedure of Fast Erase / Secure Erase

Fast Erase procedure is the basic and quicker Secure Erase procedures on SSD. The APRO Rugged Metal 2.5" SATA MLC SSD's Fast Erase function is activated via the Sanitize hardware interrupt triggered by additional two pins (J1 / Pin-1 & Pin-2) on PCB (Printed Circuit Board) as jumper setting as being shorted.

6.1 2.5" SATA SSD _BON Series Fast Erase Introduction

- Fast Erase Procedure is one of Default Sanitize Procedure in APRO Secure Erase SSD Series.
- (J1) Pin-1 & Pin-2 on PCB is defined as Fast Erase/Secure Erase Function Pin.
- To initiate Fast Erase Procedure, shorten (J1) Pin-1 & Pin-2 or insert pin hat on (J1) Pin-1 & Pin-2 when power is on and fast erase will not stop until procedure completed or power is off.
- When SSD is power-on, shortening (J1) Pin-1 & Pin-2 triggers controller firmware to program all flash blocks into 0xFF.
- 8GB SSD needs about 6 seconds, and 128GB needs about 60 seconds to run the fast erase procedure for whole disk completely.

6.2 Executing Sanitize procedure during power interruption

- After power interruption, Fast Erase/Secure Erase Procedure stops; when power is restored and (J1) Pin-1 & Pin-2 Jumper hat is not removed, Fast Erase Procedure keeps completing the procedure.
- When power is on, partition constructions by MBR (LBA-0 to LBA-X) will be destroyed immediately as "Fast Erase" is executed. Thus, no matter the power is interrupted or not, partition constructions are destroyed. To use the SSD again, partitions need to be executed low-level format again.

Figure 6: Secure Erase/Fast Erase Jumper Setting

Appendix A. Ordering Information

(1) Part Number List

◆ BON Series Rugged Metal 2.5" SATA MLC SSD supports FE/SE

Product Picture	Capacity	Standard grade (0°C ~ 70°C)	Industrial grade (-40°C ~ +85°C)

Appendix B. Limited Warranty

APRO warrants your Rugged Metal 2.5" SATA MLC SSD against defects in material and workmanship for the life of the drive. The warranty is void in the case of misuse, accident, alteration, improper installation, misapplication or the result of unauthorized service or repair. The implied warranties of merchantability and fitness for a particular purpose, and all other warranties, expressed or implied, except as set forth in this warranty, shall not apply to the products delivered. In no event shall APRO be liable for any lost profits, lost savings or other incidental or consequential damages arising out of the use of, or inability to use, this product.

BEFORE RETURNING PRODUCT, A RETURN MATERIAL AUTHORIZATION (RMA) MUST BE OBTAINED FROM APRO.

Product shall be returned to APRO with shipping prepaid. If the product fails to conform based on customers' purchasing orders, APRO will reimburse customers for the transportation charges incurred.

Warranty Period:

- SR2SFXXXG-JACMC-UFE(USE) 2 years
- WR2SFXXXG-JACMC-UFE(USE)C 2 years

The warranty period is able to extend. Please contact with APRO or Your APRO distributor for more information.
